

THANK YOU TO MSU

PSG HAS HAD OVER 100 MSU DONORS PARTICIPATE SINCE 2019

In 2019, samples that PSG collected from the MSU community were shipped to diagnostic researchers across the country and around the world. PSG promoted our Myositis samples heavily and received continual requests from R&D departments for more samples.

In an effort to help identify new myositis Biomarkers, PSG donated samples to an eminent auto-immune researcher in Japan for an immunoprecipitation experiment.

Plasma collected from the myositis community was also used to establish an auto-antibody standard for an international committee dedicated to improving autoimmune diagnostics. The same committee is currently evaluating another plasma collection from the MSU community for use as a standard for autoimmune diagnostic labs.

Although most research efforts pivoted to COVID-19 in 2020, PSG still provided rare myositis plasma to labs for proficiency testing and quality programs that ensure labs meet diagnostic standards.

Throughout 2021, PSG also provided Myositis plasma to diagnostic kit manufacturers so they could continue to use the material to make an essential component in the kits, known as controls. Without controls, labs cannot ensure that diagnostic tests are run correctly.

Late in 2021, PSG was approached by a large pharmaceutical company interested in myositis Biomarker discovery and possibly tracking treatment outcomes.

PSG is grateful to the MSU community for their dedication to IVD research and diagnostic improvement. Without you, none of this would be possible.

Thank you for making a difference and advancing research!

PSG TEAM
